

**Project Design Phase-II**  
**Technology Stack (Architecture & Stack)**

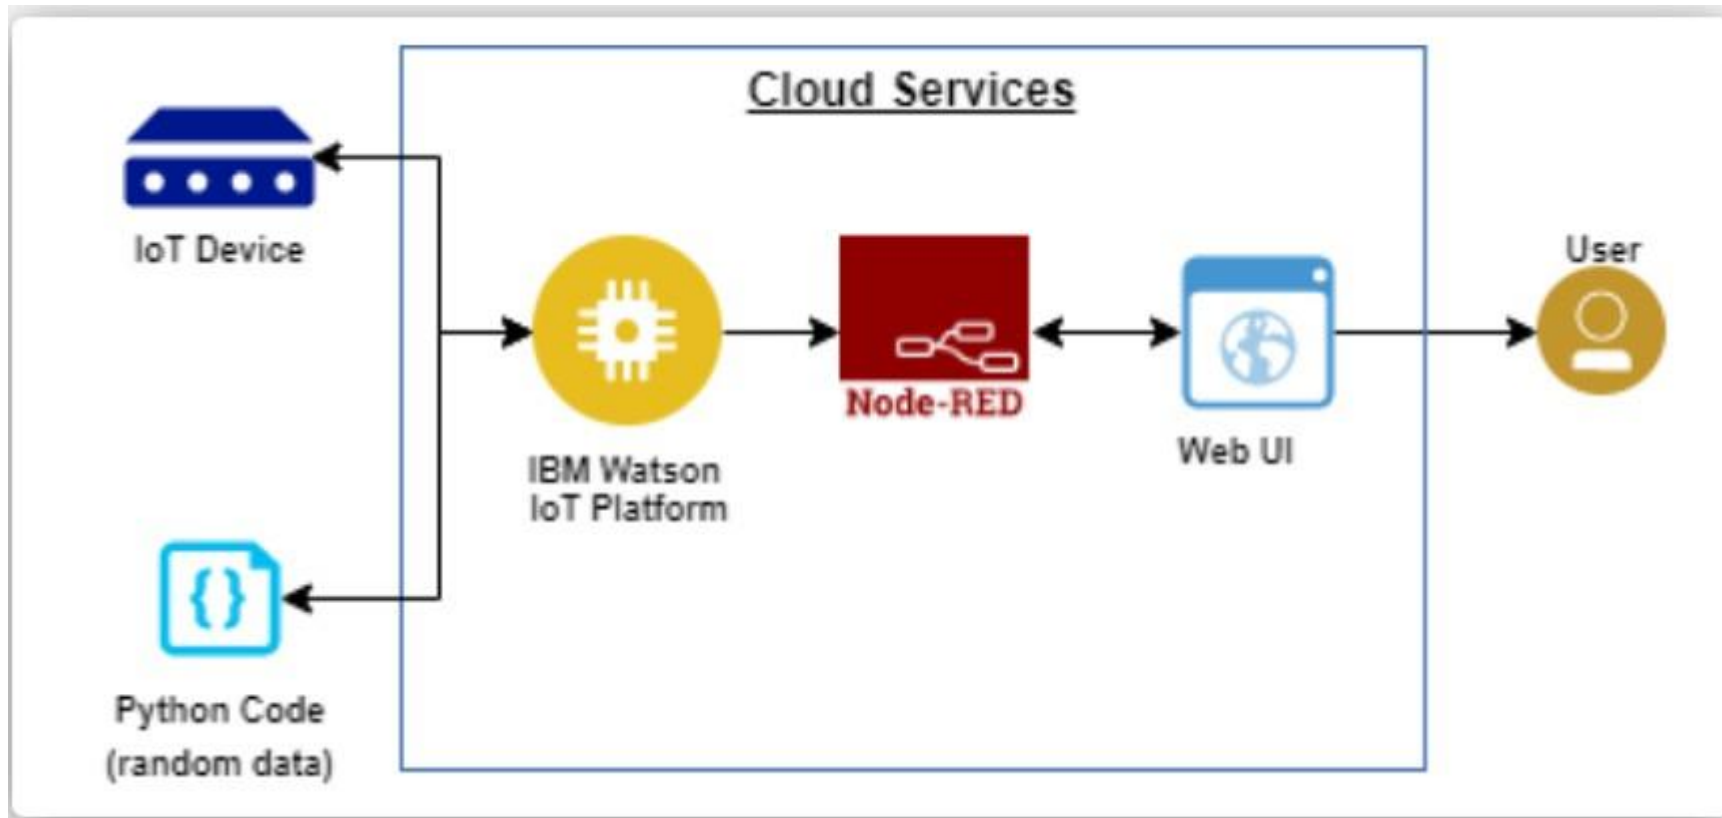

|               |   |
|---------------|---|
| Date          | 17 October 2022                                       |
| Team ID       | PNT2022TMID47912                                      |
| Project Name  | Smart waste management system for metropolitan cities |
| Maximum Marks | 4 Marks   |

**Technical Architecture:**

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

**Example: Order processing during pandemics for offline mode**

**Reference:** <https://developer.ibm.com/patterns/ai-powered-backend-system-for-order-processing-during-pandemics/>

**Table-1 : Components & Technologies:**

| S.No | Component           | Description  | Technology                |
|------|---------------------|--|---------------------------|
| 1.   | User Interface      | How the user interacts with Mobile App, Chatbot etc.   | Android studio, XML, Java |
| 2.   | Application Logic-1 | <ul style="list-style-type: none"> <li>Get Data from Server</li> <li>Present Data to User</li> <li>Put Data to Server</li> </ul> | Java                      |
| 3.   | Application Logic-2 | FireBase is used to store the user data in an efficient manner.  | Firebase - cloud storage  |

|    |                                 |   |                          |
|----|---------------------------------|---|--------------------------|
| 4. | Database                        | NoSQL Database is used to store the data in the database.                           | MongoDB                  |
| 5. | Cloud Database                  | The Database service is deployed in cloud.  | Firebase - cloud storage |
| 6. | File Storage                    | The mobile App must have at least 10MB of space.                                    | Local filesystem         |
| 7. | External API-1                  | It is used to integrate all the IoT devices.  | IBM NodeRed              |
| 8. | Machine Learning Model          | To forecast the waste to be filled in a particular day based on the streaming data. | python, IBM watson Cloud |
|    | Infrastructure (Server / Cloud) | Application Deployment  | Local, IBM watson Cloud  |

**Table-2: Application Characteristics:**

| S.No | Characteristics          | Description   | Technology       |
|------|--------------------------|---|------------------|
| 1.   | Open-Source Frameworks   | Used to create a Web Server that functions as an API to store the centralised system. | Flask            |
| 2.   | Security Implementations | Verifying the integrity of the JSON response received from the Server.                | SHA-256          |
| 3.   | Scalable Architecture    | MicroService Architecture   | Docker           |
| 4.   | Availability             | The Servers deployed in IBM Watson are load balanced by default.                      | IBM watson Cloud |
| 5.   | Performance              | The performance is taken care of by IBM cloud watson platform.                        | IBM watson Cloud |
